

Omnigent

Agent Meta Harness

Omnigent is a secure meta-harness:
**one place to govern, share, and
supervise AI agents.**

What is a harness?

A harness is the **layer wrapped around a model** that turns raw intelligence into a real workflow.

A harness enables a model to do real, actual work.

Managed on DB: TBC
Open-source: GA

What problems does it solve?

1

Governance

Secure – Governed autonomy at scale

2

Lock-In

Portable – Standardize once, never replatform

3

Fragmentation

Collaborative – Agent work becomes a shared asset

Omnigent is a secure meta-harness:
**one place to govern, share, and
supervise AI agents.**

What is a harness?

A harness is the **layer wrapped around a model** that turns raw intelligence into a real workflow.

A harness enables a model to do real, actual work.

Open-source: GA

What is a harness?

MODEL

*The AI brain
thinks, can't act.*

Ex: Claude 4.7,
GPT-5, Gemini

HARNESS

*Enables the brain
to take action.*

Ex: Claude Code,
Codex, Cursor

AGENT

*Understands
information and
take actions to
achieve a goal.*

What is a harness?

MODEL

*The AI brain
thinks, can't act.*

Ex: Claude 4.7,
GPT-5, Gemini

HARNESS

*Enables the brain
to take action.*

Ex: Claude Code,
Codex, Cursor

AGENT

*Understands
information and
take actions to
achieve a goal.*

Managed on DB: TBC
Open-source: GA

84%

of developers
use coding agents

Too many harnesses to manage!

Security Risk

Lock-in

Fragmentation

**67% of developers
use 2+ harnesses**

**~50% can't run them autonomously
because of security and cost risk**

What is a harness?

A harness is the **layer wrapped around a model** that turns raw intelligence into a real workflow.

A harness enables a model to do real, actual work.

Omnigent on Databricks

Problem 1: Governance

Omnigent checks every action an agent takes and blocks the risky ones before they happen.

Managed on DB: TBC
Open-source: GA

Problem 2: Lock-In

Omnigent uses the best tool for each part of the job, and lets you swap them out without starting over.

Problem 3: Fragmentation

Personas

Managed on DB: TBC
Open-source: GA

CISO / Security Lead

- CISO, Head of Security, Security Architect
- **WINS** — Approves autonomous agents because the guardrails are enforced by the runtime. Policies, not prompts. Every session is auditable.

Plus, with open-source, they can look at their own code!

Platform / Dev Tools Team

- Platform Lead, Developer Experience, Engineering Platform
- **WINS** — One standard across every harness. Inherits existing CLAUDE.md, skills, and MCPs. Swaps models with no re-platforming.

Cutting edge developers

- Research and development, developer teams pushing for state of the art solutions
- **WINS** — The best, state of the art tools for the job while staying inside company policies. Optimize cost by getting the best model for the best cost.

Competitive Landscape

Omnigent works with a customer's existing harnesses to maximize their experience

- The meta-harness layer that works with other harnesses
- No enterprise-ready, production-grade alternative

Managed on DB: TBC
Open-source: GA

Let's Look a Little Closer:

ClaudeCode (Anthropic)

Omnigent competes with Anthropic / Claude Code by **sitting one layer above the coding agent**:

- Claude Code is the **strong first-party agent / assistant**.
- Omnigent is the **portable control layer** for running, supervising, sharing, and governing Claude Code alongside other agents.

Codex (OpenAI)

While developers use Codex, enterprises can use Omnigent as the **layer that runs Codex alongside** Claude Code and custom agents:

- OpenAI Codex specializes in long horizon, multi session **engineering** tasks.
- **Omnigent adds features that enterprises need:** shared sessions, policies, context, and collaboration.

OpenClaw, Pi, GasTown, etc

Omnigent is the **portable control layer** for running, supervising, sharing, and governing agents **across all services**:

- Pi is portable multi model terminal usage → **heavy setup required**
- Gas Town is local multi agent orchestration → **no managed hosting**
- OpenCode/OpenUI is multi-surface coding UX → **no governance**
