

Chat or Agent?

Genie has two ways to answer. Picking the right one is the difference between an answer in **seconds** and a full analysis that takes **minutes**.

Asking a **question?** Use Chat. · Commissioning an **analysis?** Use Agent.

 Chat

The fast lane

Direct answers, in seconds.

USE IT WHEN YOU WANT

A **number, a metric, a chart, or a lookup** — a single, specific answer you already know how to ask for.

EXAMPLE QUESTIONS

"How many stoppages last month?"

"Show HPI events by operation."

"Top 5 sites by control failures."

YOU GET

One answer with a table or chart — 1–2 queries.

SPEED

Seconds near-instant

 Agent

The deep dive

Autonomous multi-step analysis.

USE IT WHEN YOU WANT

To understand **why** something happened, explore an open-ended question, or produce a **shareable report** — work you'd normally hand to an analyst.

EXAMPLE QUESTIONS

"Why did stoppages spike in Q2?"

"Analyze the correlation between HPIs and stoppages."

"What's driving control failures across sites?"

YOU GET

A **multi-step narrative report** (10+ analyses) with key insights and a downloadable PDF.

SPEED

Minutes by design — it's doing an analyst's job

Why Agent takes longer — and why that's normal

Chat		~ seconds • 1 query
Agent		~ minutes • 10+ steps

Agent isn't slow — it's thorough. It breaks your question into many sub-analyses, runs each, and writes up the findings. That depth takes minutes regardless of how small the data is. If you just need a quick answer, Chat gets it in seconds.

👉 Switch modes with the **Chat / Agent toggle** in the question box before you ask. Your choice sticks for next time — so set it to **Chat** for everyday questions and switch to **Agent** only when you want a full analysis.
